Summary

Senior Software & Systems Engineer specializing in high-availability public infrastructure and containerized Go microservices. Proven track record of driving zero-downtime blue/green deployments, managing AWS infrastructure at scale, and architecting resilient edge systems.

Comfortable working across the entire spectrum: system/scripting logic to client applications and user interfaces be they CLIs or TUIs or Websites.

Technical Core

- **Languages & Runtime:** Go (gRPC, microservices), TypeScript, React, Python, Ruby, SQL, Bash. I work with a lot of Go. I really do.
- **Cloud & Edge Architecture:** AWS (ECS, Aurora PostgreSQL, S3), Kong API Gateway, Akamai CDN/WAF, Redis Caching.
- **DevOps, Delivery & Security:** CloudBees Jenkins, LaunchDarkly, Nix / NixOS, Terraform, Docker, SonarQube, JFrog Xray.
- **Observability & Quality Assurance:** New Relic, Splunk. 24/7 On-Call Support.

Experience

Ad Hoc LLC

2022 – Present

Seattle, WA

Senior Software Engineer

- Architecting these high-throughput, containerized Go microservices on AWS behind Kong and Akamai.
- Engineering mobile-first React and TypeScript interfaces. They're strictly WCAG 2.2 Level AA and Section 508 compliant, because I hate it when people are excluded. I really do.
- Gating CloudBees Jenkins pipelines with automated accessibility tools so regressions can't sneak in alongside the unit and end-to-end suites. No exceptions.
- Managing Aurora PostgreSQL data stores and Redis caches just to keep the API latency down for all that high-concurrency public traffic.
- Using LaunchDarkly for feature flags and blue/green deployments so there's zero downtime.
- Carrying this 24/7 on-call rotation. Getting woken up by New Relic and Splunk alerts at ungodly hours.
- Triaging SonarQube, and JFrog Xray vulnerabilities directly in the active sprint.

Sinch

2020 – 2022

Bothell, WA

Software Engineer

- Built dynamic SMS and RCS messaging workflows powered by high-concurrency Ruby proxy layers.
- Refactored their legacy Content Management Systems. The old architecture was completely phony, so I documented it properly and cut down the onboarding time to save the new devs some grief.

Various Startups

2017 – 2020

Seattle, WA

Software Engineer

- Did a full architectural migration of legacy Node.js authentication services to idiomatic Go. Reduced the request latency and server resources, which actually wasn't too crummy.
- Designed normalized MySQL database schemas and asynchronous job queues to keep the safety-critical backend operations from blowing up.
- Authored cross-platform desktop utilities in Electron and Vue.js for configuring wireless hardware beacons.

Merchant-e Solutions

2017

Atlanta, GA

Software Engineer

- Engineered custom Node.js CLI utilities for direct database querying.
- Standardized the containerized local development stacks using Docker and upgraded the enterprise Nginx and Apache web server configurations.

Liaison Technologies

2015 – 2017

Atlanta, GA

Software Engineer

- Built RESTful API endpoints using Node.js and Hapi.js. Had to collaborate with distributed Agile engineering teams, which is fine if you're into that sort of thing.

Education

City University of Seattle

2024 – Present

Seattle, WA

Master of Science in Computer Science

School of the Art Institute of Chicago

2006 – 2011

Chicago, IL

Bachelor of Fine Arts

Additional & Systems Interests

-
- NixOS, OpenBSD, and custom Linux kernel/workstation configuration practitioner. I contribute to open source tools, if you want to know the truth.
 - Embedded devices enthusiast. I actually spend time cross-compiling my own custom NixOS SD card images for single-board micro-controllers, which probably sounds crazy, but I swear it isn't.
